

# MODBOX™

## diy mini solar car

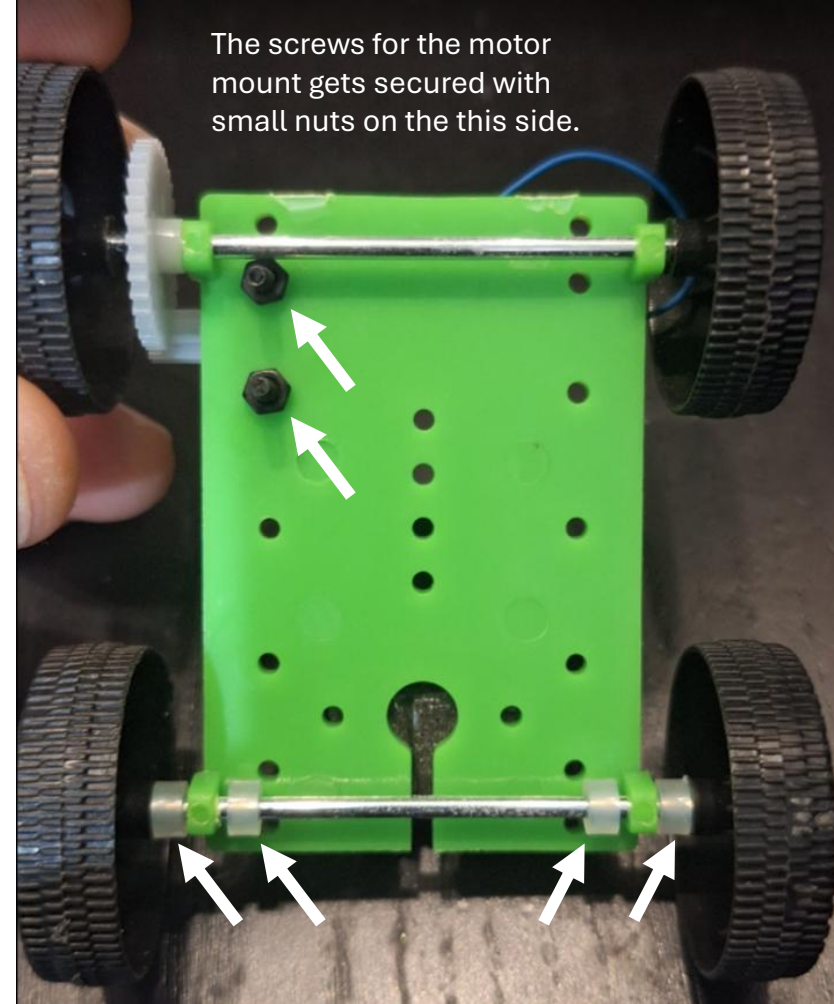

Stick the solar cell on the chassis of the car using double-back tape, which is provided.

Put this gear on the axle and line it up with the motor.

Make sure to install the motor mount in these exact holes. Use the two small screws that were provided.

The screws for the motor mount gets secured with small nuts on the this side.

Use the small plastic washers to ensure the axle doesn't slip from side to side.

### READY TO GO?

#### **Important note:**

This solar cell only works in absolute sunlight. You have to take it outside, it needs those UV rays! It won't work with light bulbs even if they're really bright. Take it out on a sunny day at noon, in clear view of the sun. No trees or other obstacles.
